1. What is a key benefit of monthly slow-release nitrogen applications in lawn care?

- A. They provide a steady nitrogen supply, reducing flush growth**
- B. They cause rapid, short-term growth bursts**
- C. They eliminate the need for watering**
- D. They permanently prevent disease**

The release rate of nitrogen determines how quickly the turf can use it and how growth patterns develop. Monthly slow-release nitrogen provides a steady supply over time, so the grass takes up nitrogen gradually and growth stays uniform rather than spiking after a feeding. That steadier supply reduces flush growth, the rapid, soft growth bursts that lead to more mowing and can stress the lawn. Because nitrogen isn't dumped all at once, you don't get those rapid, short-term growth bursts. It doesn't eliminate the need for watering, and it doesn't permanently prevent disease. So the best answer is that the steady nitrogen release keeps growth even and reduces flush growth.

2. The dimensions for mens and womens lacrosse fields are dramatically different from each other.

- A. False**
- B. True**
- C. Not specified**
- D. They are the same**

Field dimensions differ between men's and women's lacrosse. The two versions of the game are governed by different rulebooks, each specifying its own field layout, markings, and restraining/crease areas. This leads to noticeably different playing areas for the two versions, reflecting the distinct styles of play and rules. Because of these official differences, the statement that the dimensions are dramatically different is true.

3. Which term best describes the approach that uses a combination of cultural practices to manage necrotic ring spot?

- A. Integrated Disease Management**
- B. Cultural pest control**
- C. Chemical control**
- D. Monotherapy**

The approach that combines cultural practices to manage a turf disease is Integrated Disease Management. This concept focuses on using multiple strategies together—such as proper irrigation, fertilization, mowing height, aeration, and soil drainage—so disease pressure is reduced without relying on a single method. For necrotic ring spot, tweaking cultural factors often has a big impact, and an IDM plan integrates these cultural steps with other controls only as needed, aiming for healthier turf and fewer fungicide applications. The other terms don't fit because they describe single methods or a nonstandard label: cultural pest control isn't the established term for disease management, chemical control focuses on chemicals alone, and monotherapy means using just one treatment.

4. As long as they are stable, moveable soccer goals are far superior to fixed goals in maintaining high quality turf.

- A. False**
- B. Sometimes**
- C. True**
- D. Not sure**

Spreading wear and managing soil compaction are key to maintaining good turf. When goals are moveable and kept stable during use, you can relocate them regularly, which distributes the load from players, balls, and maintenance equipment across a larger area. A fixed goal concentrates traffic and stress in one spot year after year, leading to compacted soil, crown damage, thinning turf, and slower recovery. By repositioning moveable goals (and removing them when not needed), you minimize persistent wear patterns, improve drainage, and give stressed patches a chance to recover. So, with stability in place, moveable goals are better for turf quality than permanently fixed ones.

5. The statement 'Nature Lawn of America does not use pesticides' is true or false?

- A. True**
- B. False**
- C. Not sure**
- D. It depends**

In turf care, pesticide use is a common tool for protecting grass health and appearance. The statement is false because even programs that emphasize environmentally friendly or IPM approaches still rely on pesticides when pests, diseases, or weeds threaten the turf and thresholds are reached. Pesticides encompass herbicides, fungicides, and insecticides, and manufacturers and services may apply them under label guidelines to keep lawns healthy. Marketing claims of “no pesticides” can be misleading, as some situations legitimately require controlled, targeted pesticide use or the use of organic/bio-pesticide products. So, the idea that a professional lawn service never uses pesticides isn't true.

6. Which disease is commonly known as melting out?

- A. Melting out**
- B. Pythium blight**
- C. Brown patch**
- D. Dollar spot**

Melting out describes a turf disease that causes a rapid collapse of infected patches, making the turf look as if it's melted away. The giveaway is the water-soaked, greasy, soft appearance of the leaves as the tissue breaks down quickly. This happens most when conditions are warm and humid and the leaf surface stays wet, such as after late-day irrigation or heavy dew. The culprit behind this dramatic symptom is Pythium blight, a pathogen that can spread swiftly across turf, collapsing blades and stolons in a way that feels like the turf is liquefying. Other listed diseases have different looks—brown patch forms large circular patches with a distinct brown ring, and dollar spot shows small, pale spots on the leaf blades—so they don't produce the same rapid, melted appearance seen with Pythium blight.

7. The tee box term historically referred to what?

- A. A wooden box that held wet sand to build up a mound for the ball**
- B. A bag of tees used to tee off
- C. A flagstick used to mark the hole
- D. A container for water on the course

The main idea here is the historical origin of the tee box. In the early days of golf, players needed a way to lift the ball slightly for a clean, powerful drive. To do this, they formed a small mound of damp sand and used a wooden box to hold that sand, shaping and supporting the mound so the ball could rest on top. This wooden sand box created a ready-made “tee” and the area where players prepared it came to be known as the teeing ground or tee box. Over time, devices evolved from sand mounds in a box to separate tees, but the name stuck. The other options don’t fit because they describe elements not historically tied to how the tee or teeing ground originated.

8. Does the number of customers that hire national lawn care companies continue to increase?

- A. True
- B. False**
- C. It fluctuates
- D. Not enough data

The idea being tested is whether a market trend can keep moving upward without interruption. Without solid data showing a steady year-after-year rise in the number of customers, you can’t confidently say it will continue to increase. In the lawn care market, demand is influenced by many factors—competition, pricing, marketing, economic conditions, and customer churn—so the customer base can grow, level off, or even shrink at different times. Because of this variability, claiming a continuous increase isn’t justified.

9. The dimensions for mens and womens soccer fields are dramatically different.

- A. True
- B. False**
- C. Not specified
- D. They are the same

Field sizes in soccer are defined by the laws of the game and apply to both men and women, not by gender. The official ranges specify the same pitch dimensions for top-level matches, with international fields typically between 100-110 meters long and 64-75 meters wide, and other senior matches allowed to be 90-120 meters long and 45-90 meters wide. These guidelines show that the field size is set by competition level, not by whether the players are men or women, so the claim that dimensions are dramatically different is not correct. Youth or recreational play may vary due to age or facilities, but that isn’t a gender-based rule.

10. A golf cup has an inside diameter of approximately __ inches.

A. 3

B. 4

C. 5

D. 6

Golf holes are standardized to a specific inner diameter so the game remains fair and consistent. The official size is 4.25 inches across, which is the inside diameter of the cup. When rounded for practicality, that becomes about 4 inches. So the option that's closest to this standard is the one labeled around 4 inches. A hole that is 3 inches would be too small for the ball to consistently drop through, while a hole of 5 or 6 inches would be much larger than the standard and would change the challenge of putting. Therefore, approximately 4 inches is the best answer.
